GLP-1 Receptor Agonist

Type of drug	Incretin
How does it work?	 Acting when sugars are higher than normal, increases insulin levels (help lower blood sugar) and decreases glucagon (a hormone that raises blood sugar) Slows the emptying of the stomach
Typical names	Liraglutide (Victoza®), Exenatide (Byetta®)
Usual doses	 Liraglutide 0.6 - 1.8 mg administered once daily by subcutaneous injection Exenatide 5-10 ug administered by subcutaneous injection twice a day
Dosing instructions	 Liraglutide usually started at 0.6 mg once daily for 1 week then increase to 1.2 mg once daily Exenatide usually started at 5 ug taken twice daily within 60 minutes of a meal for 1 month and then may be increased to 10 ug taken twice daily within 60 minutes of a meal
What if I forget a dose?	Ask your healthcare provider
A1C lowering (↓ = least, ↓↓↓ = most)	↓↓ to ↓↓↓
Effect on weight	↓↓
Risk of low blood sugar (hypoglycemia)	Rare
Medication considerations and/or side effects	 Very low rates of hypoglycemia and possible weight loss Side effects are mainly related to stomach and intestines: (e.g. nausea: may be more with Extenatide) which can be improved by proper dose adjustment of the medication and should improve with time
When to call your doctor	You develop any severe side effects and any negative changes in your overall health talk to your health care provider
When you are sick	Take this medication as directed, unless otherwise directed by your healthcare provider
Cost (\$ = lowest, \$\$\$\$ = highest)	\$\$\$\$
