

## Continuous Glucose Monitoring (CGM): The Basics

Continuous glucose monitoring (CGM) allows you to see glucose readings 24 hours a day while doing few or no finger stick tests. CGM uses a small wearable device to measure interstitial glucose (glucose that has left the blood and moved into the tissues).

Interstitial glucose readings are slightly “older” than blood glucose readings by about 4-5 minutes. This lag can be as long as 15 minutes if blood glucose levels are changing quickly e.g. after eating meals or treating a low blood sugar.

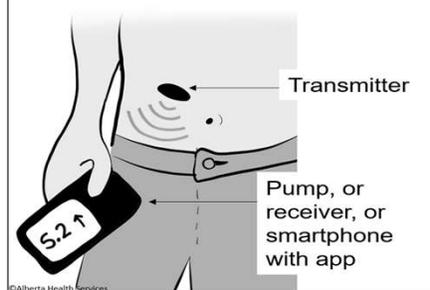

### How CGM Works

A glucose sensor (small electrode) is inserted under the skin and measures interstitial glucose every 1-5 minutes. The readings are sent wirelessly to a device, either automatically or by manually scanning the sensor with a reader. There are two major types of CGM.

### Types of CGM

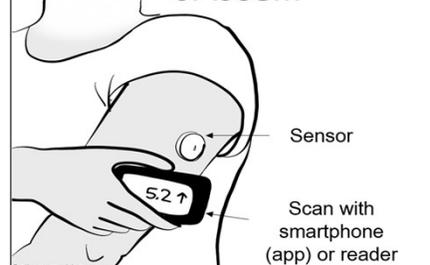

#### Real-Time CGM or rtCGM

All brands require finger testing if symptoms don't match CGM readings. One brand requires finger stick testing twice daily for calibration. Some brands integrate with some insulin pumps.

Real-time CGMs (rtCGM) have a transmitter attached to a sensor. The transmitter automatically sends glucose readings every 5 minutes to an app on a smartphone, a hand held receiver or an integrated insulin pump. These CGMs can also alarm when glucose levels reach certain limits.

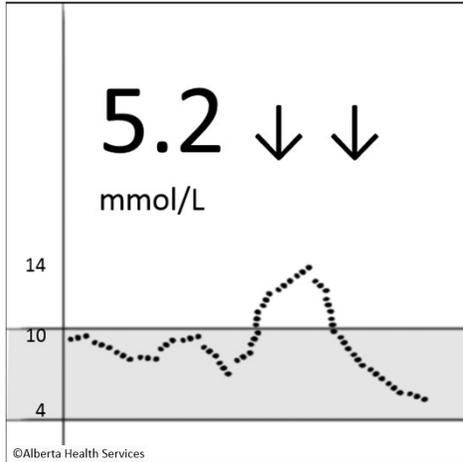

#### Intermittently Scanned or isCGM

Intermittently scanned CGMs (isCGM) may alert the user that a glucose level is out of target. However, the user must scan the sensor with a smartphone (app) or a reader to see the glucose reading. New readings are available every 1 minute, if scanned. The sensor must be scanned at least once every 8 hours to capture all the data to review in graphs later.

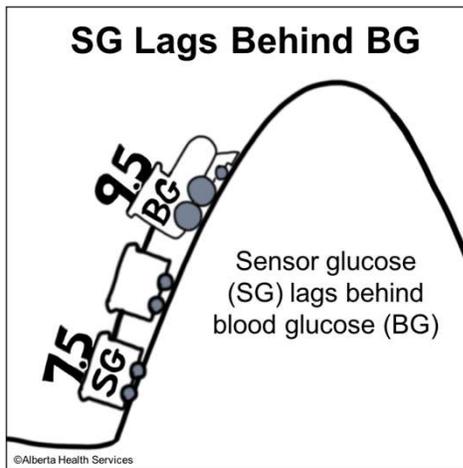

# Continuous Glucose Monitoring (CGM): The Basics

## Benefits

- CGM use may help improve glucose levels. It may help you find glucose patterns and make daily management decisions as well as alert you with alarms to readings that are out of target.
- CGM provides more information than finger stick tests. CGM provides a current glucose reading, a graph of previous hours' readings and rate of change (ROC) arrows. A reading of 5.2 mmol/L ↓↓ (dropping quickly) would likely require action to prevent a low, whereas a 5.2 mmol/L → (stable) might not.

## Challenges

- Some challenges of CGM include cost, alarm fatigue, feeling overwhelmed by data (this could lead to too many insulin adjustments), unrealistic expectations, skin irritation and still needing finger stick glucose tests for some situations.
- Another challenge is remembering that sensor glucose (SG) readings can lag behind blood glucose (BG) readings at times.

**Brands** – please contact companies for pricing. Sensor wear length & cost (\$80+/-) varies.

1. Abbott's Libre 2 (isCGM) <https://myfreestyle.ca>
  - 2021 sensor wear time is 2 weeks. Requires smart phone app (free) or reader. No separate transmitter is required.
2. Dexcom G6 (rtCGM) [www.dexcom.com](http://www.dexcom.com)
  - 2021 sensor wear time is 10 days. A separate transmitter is required and lasts 100-112 days. Requires a smart phone app (free) or stand-alone receiver (separate purchase).
3. Medtronic Guardian Connect CGM (rtCGM) <https://www.medtronic.com/ca-en/diabetes/home.html> choose Diabetes Products > CGM systems
  - 2021 sensor wear time is 7 days. A separate rechargeable transmitter is required and lasts a year or longer. A free smart phone app is required.
